

Mapping policies towards a thriving apiculture

The situation

There are wide variations in countries' honey consumption and production. This figure shows BeSafeBeeHoney countries with the lowest and highest honey production per capita per year:

The goal

We would like to understand if the differences between countries are caused by policies (including laws, regulations, statutory orders, standards, subsidy schemes)?

Mapping policies

Within the frame of WG5, we organised a survey to identify examples of policies that are positive or negative for the apiculture sector. The thesis is that high production and consumption of honey is correlated with favourable policies. Analysed results will be presented and discussed in the WG5 meetings, who also plan to use the results for preparation of policy recommendations.

We would like to have your perspectives on this, and it is easy to participate - go to <https://tinyurl.com/3stkyhfh> or access via the QR code here:

Please respond yourself, if possible, and also help to spread the survey in your network, especially to persons and organisation that are willing to express their opinion about these matters, including beekeepers and their organisations in your country.

For any enquiries about this policy survey, please contact WG5 Leader, Mr. Henning Lyngsø FOGED, ORGANE, henning@organe.dk, mob. +45 6141 5441.
